Introduction

Background

The USDA's National Animal Health Monitoring System (NAHMS) has conducted three national swine studies, one each in 1990, 1995, and 2000. Data were collected from randomly selected farms via questionnaires, producer diaries, logs, biological sampling, and environmental sampling. This information has been released to the public via seven descriptive reports and a number of info sheets as well as other references. Quickly and efficiently locating specific information has become a challenge.

Purpose

This index has been created to assist in accessing this important information quickly and efficiently.

How to Use

- Topics are listed alphabetically on pages 1-25. Descriptive reports, info sheets, and other references indexed are listed in the back (pages 27-30).
- The majority of information generated from NAHMS studies can be found in the seven descriptive reports which are identified as column headings. Page numbers in the column identify where to find information on that topic. Letters A-Y in the column identify the info sheet which contains information on the topic.
- All other reference material is cited by number (1-51) in the last column.

It is our hope that this index will be of value in locating the specific information from our NAHMS studies.
